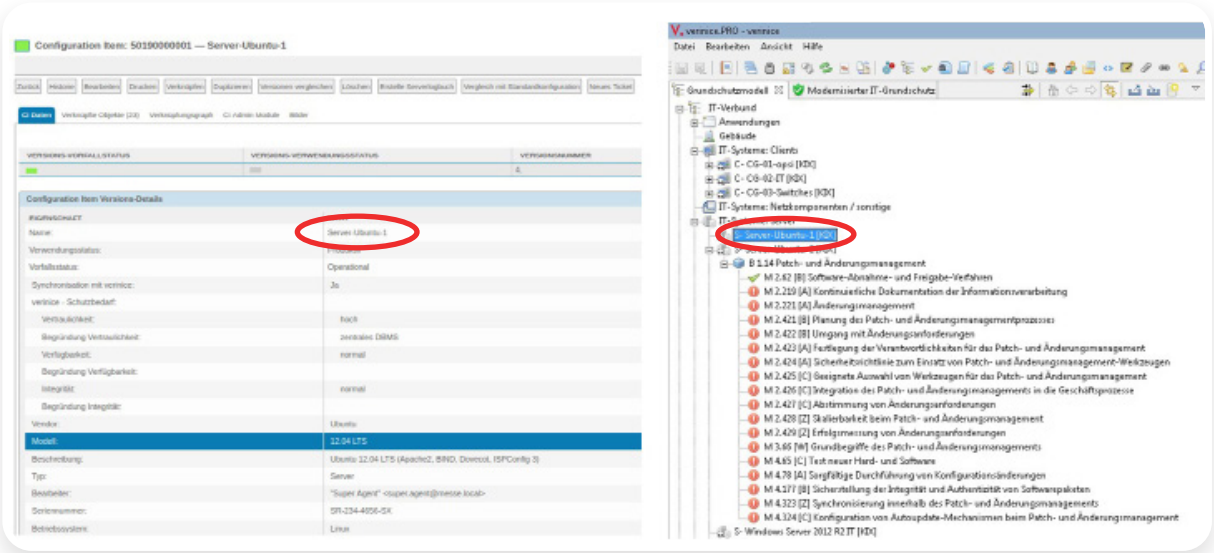
KIX PRO ADD-ON FEATURE SECURITY MANAGEMENT

SEAMLESS INTEGRATION BETWEEN ITSM AND SECURITY MANAGEMENT

As digitalization continues to spread, different systems are being networked with one another. As a result, it is becoming ever-more important to protect your data and ensure public safety and security. Operators of critical IT infrastructure, such as energy providers, hospitals, authorities, and logistics companies, therefore constantly need to monitor and update their security strategies. When doing so, they also need to factor in the German federal government's „KRITIS" program on critical infrastructure.

The security management add-on feature enables you to establish a seamless, workflow-based connection between an ISMS tool (information security management) and KIX Pro (version 17). This will enable your security management and IT service to dovetail with one another even more closely.

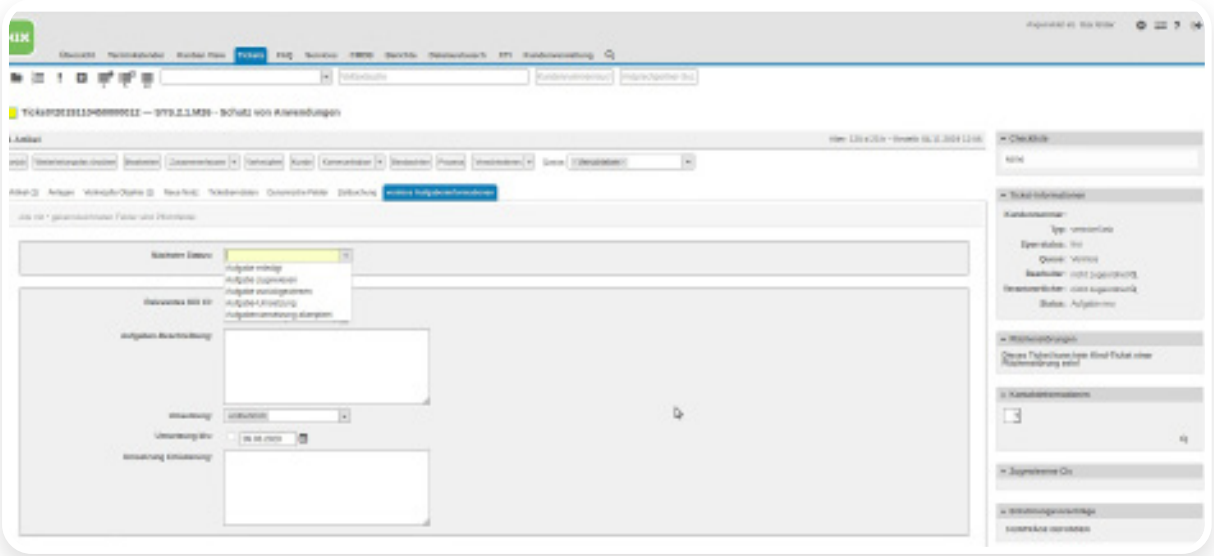


Comparison of the inventory data from the CMDB in the modeled IT network of the ISMS verinice.PRO.

THE BENEFITS TO YOU

- Your security and IT structures are integrated and harmonized with each other.
- Comprehensive documentation on the implementation of security measures is ensured.
- The add-on feature helps you to plan and implement measures for complying with the IT baseline protection standard („IT-Grundschutz") set by the German Federal Office for Information Security and with ISO 27001.

In a nutshell: You get maximum networking for minimal outlay – the very essence of modern security management with that certain something extra.



Documentation of the implementation of a measure and its status in the IT service when it is transferred to verinice.Pro.

FEATURES

- Device data is compared with the information management system (ISMS) verinice.Pro (SerNet).
- The IT security officer can easily plan and report on the security measures in the ISMS.
- The work required for the measures to be implemented and the synchronization of tasks in KIX Pro (version 17) can be assigned to the IT department.
- The add-on feature makes it possible to coordinate and monitor the implementation of measures centrally within KIX, including automatically comparing the status in the ISMS.
- Full, up-to-date documentation for security audits (incl. the requirements set by the German Federal Office for Information Security in its IT baseline protection standard („IT-Grundschutz")) is ensured.
